

## Logistics Planning and Simulation

Optimising the capacity of logistics facilities and scenarios through simulation

### Product Description

Precise planning of supply or transshipment logistics enables significant optimisation of the capacities to be deployed as well as the configuration of the required facilities. Through our simulation work, we help optimise the capacity of existing facilities and/or support the planning process for new facilities and logistics projects.

With our simulation expertise, we can support all types of logistics processes (road transport, rail transport, maritime transport, air transport, and multimodal/intermodal transport). We cover all issues related to procurement logistics, production logistics, distribution logistics, and waste/disposal logistics.

The results can be made available to all project stakeholders via a web viewer or in traditional documents (e.g. Gantt schedules, etc.).

### Our Services

- Logistics planning and simulations of all kinds
- Optimisation of facilities and scenarios
- Support in the planning of logistics facilities
- Capacity analysis of facilities
- Comparison of alternatives
- Target/actual monitoring

### Your advantages

- Optimised facility planning through simulation
- Optimisation of logistics processes
- Verifiable utilisation levels of facilities
- Visually verifiable results
- Virtual planning and validation of new logistics concepts
